

DETAX - a world leader for otoplastic consumables

Detax says, "The continuous high quality of our products and our employees' commitment convince our customers every day. We devise efficient and environmentally friendly manufacturing processes and carry out intensive research with the latest raw materials. This results in pioneering product ideas and new opportunities, such as *addition nano*, the first impression material with nanoparticles, comes out of a cartridge in a creamy, low-viscous consistency. New flow characteristics allow an entirely pressure-less impression taking, with highest detail reproduction. The geometry of the new Detax mixing tip *optima* also ensures even more safety when taking an impression. Together with *vario mix* – the "one fits all" dispenser for all cartridge systems – it's a "full service package". *aquaplus** *colormix*, floatable special silicone is now available in multicoloured fluorescent colours. Thus, soft-flexible BTE earmoulds and protectors can be made of *earflex*, comfortable in mass-production, providing skin-friendly earmoulds with highest wearing comfort. *bio coat* spray*, the first solvent-free one component lacquer for earmoulds, can now be sprayed on, simply and safely. Detax want to thank all visitors at the EUHA Congress for the lively dialogue - they look forward to seeing them again in 2010!
